        In this paper, we describe the design and implementation of a distributed operating system for
        ad hoc networks. Our system simplifies the programming of ad hoc networks and extends total
        system lifetime by making the entire network appear as a single virtual machine. It
        automatically and transparently partitions applications into components and dynamically finds
        them a placement on nodes within the network to reduce energy consumption and to increase
        system longevity. This paper describes our pr ...

        Publisher: ACM Press
        Full text available: 🔁 pdf(3.14 MB)   Additional Information: full citation, abstract, references, citings, index terms

        ZebraNet is a mobile, wireless sensor network in which nodes move throughout an
        environment working to gather and process information about their surroundings[10]. As in
        many sensor or wireless systems, nodes have critical resource constraints such as processing
        speed, memory size, and energy supply; they also face special hardware issues such as
        sensing device sample time, data storage/access restrictions, and wireless transceiver
        capabilities. This paper discusses and evaluates ZebraNet's syst ...

1 Special issue: AI in engineering
D. Sriram, R. Joobbani
April 1985   **ACM SIGART Bulletin**, Issue 92
Publisher: ACM Press
Full text available: 🔲 pdf(8.79 MB)   Additional Information: full citation, abstract

> The papers in this special issue were compiled from responses to the announcement in the July 1984 issue of the SIGART newsletter and notices posted over the ARPAnet. The interest being shown in this area is reflected in the sixty papers received from over six countries. About half the papers were received over the computer network.

2 Operating systems for sensor networks: Design and implementation of a single system image operating system for ad hoc networks
Hongzhou Liu, Tom Roeder, Kevin Walsh, Rimon Barr, Emin Gün Sirer
June 2005   **Proceedings of the 3rd international conference on Mobile systems, applications, and services MobiSys '05**
Publisher: ACM Press
Full text available: 🔲 pdf(261.28 KB)   Additional Information: full citation, abstract, references, cited by, index terms

> In this paper, we describe the design and implementation of a distributed operating system for ad hoc networks. Our system simplifies the programming of ad hoc networks and extends total system lifetime by making the entire network appear as a single virtual machine. It automatically and transparently partitions applications into components and dynamically finds them a placement on nodes within the network to reduce energy consumption and to increase system longevity. This paper describes our pr ...

3 Wide-area monitoring of mobile objects: Implementing software on resource-constrained mobile sensors: experiences with Impala and ZebraNet
Ting Liu, Christopher M. Sadler, Pei Zhang, Margaret Martonosi
June 2004   **Proceedings of the 2nd international conference on Mobile systems, applications, and services MobiSys '04**
Publisher: ACM Press
Full text available: 🔲 pdf(3.14 MB)   Additional Information: full citation, abstract, references, citings, index terms

> ZebraNet is a mobile, wireless sensor network in which nodes move throughout an environment working to gather and process information about their surroundings[10]. As in many sensor or wireless systems, nodes have critical resource constraints such as processing speed, memory size, and energy supply; they also face special hardware issues such as sensing device sample time, data storage/access restrictions, and wireless transceiver capabilities. This paper discusses and evaluates ZebraNet's syst ...

4   Dynamic data fusion for future sensor networks

Umakishore Ramachandran, Rajnish Kumar, Matthew Wolenetz, Brian Cooper, Bikash Agarwalla, Junsuk Shin, Phillip Hutto, Arnab Paul
August 2006 **ACM Transactions on Sensor Networks (TOSN)**, Volume 2 Issue 3

Publisher: ACM Press

Full text available: ⊞ pdf(2.44 MB)   Additional Information: <u>full citation</u>, <u>abstract</u>, <u>references</u>, <u>index terms</u>

DFuse is an architectural framework for dynamic application-specified data fusion in sensor networks. It bridges an important abstraction gap for developing advanced fusion applications that takes into account the dynamic nature of applications and sensor networks. Elements of the DFuse architecture include a fusion API, a distributed role assignment algorithm that dynamically adapts the placement of the application task graph on the network, and an abstraction migration facility that aids such ...

Keywords: Sensor network, data fusion, energy awareness, in-network aggregation, middleware, platform, role assignment
